

# Sec App Dev 2010

The View From the Giants'  
Shoulders

Ken van Wyk

# Ken van Wyk -- [ken@krvw.com](mailto:ken@krvw.com)

## Work Experience

- 20+ years in Information Security
  - Carnegie Mellon University CERT/CC Founder
  - U.S. Department of Defense CERT
  - SAIC, Para-Protect
  - President and Founder, KRvW Associates, LLC (<http://www.krvw.com>)

## Security Work

- Technical lead on hundreds of commercial engagements since 1996, including
  - Application security assessments
  - Enterprise risk assessments
  - Secure network architecture
  - Security testing of enterprises and applications
- Author of two popular O'Reilly and Associates books
  - Incident Response: Planning and Management
  - Secure Coding: Principles and Practices

## Credentials

- BS Lehigh University 1985, Mechanical Engineering

## Personal Interests

- Travel, world cuisine, wine, mountain biking, zymurgy

## Family (<http://www.vanwyk.org/ken>)

- Wife, two spectacularly spoiled basset hounds

# Introductions

Please tell us a little about your

- Software interests
- Software dev technologies
- Any specific topics you want to learn about this week?

# Headlines

# Why aren't things improving?

# Learn from history

We don't pay enough attention to our failures

Consider other engineering disciplines

- Study and learn from mistakes
- Continuous improvement

# Lack of knowledge

Developers tend to lack security knowledge

Security team tends to lack development knowledge

Not healthy

–“Us” and “them”

# We're overly trusting

We tend to have  
misplaced trust in our  
users

Sometimes users are  
malicious

Sometimes they don't  
even try to be

# Focus

- Too much attention is paid to functional spec
- Consider what can go wrong as well
- Most of what we care about in security is in the non-functional areas

# Old school paradigms

Old school information security solutions don't adequately protect the software

Consider IM, Skype, WiFi, VPNs

# Testing isn't working

Software testing does not adequately address security

Penetration testing is not sufficient

# The Road Ahead

If that's not enough,  
what should we do  
differently?

You'll hear many  
answers to that this week

Let's consider a few  
things first

# What is “secure enough”?

Is it enough to stop the bad guys?

What about interfacing with the security team?

What other responsibilities do we have?

# Case study: Biotech firm

Business servers  
crashing 1-2 times per  
day

Security personnel found  
a “ping of death” attack

- Originating on a company  
PC
- Which one? ???
- Logs vacuous

# Case study, cont'd

Company called in  
outside CSIRT to  
investigate

System logs told us  
almost nothing

Network data showed  
level 3 data

–Attacker spoofed IP

# Case study, cont'd

## Impact

- Downtime ~ 48 hours
- Costs ~ USD\$10 M
- Not reported publicly
- Attacker found but never arrested

## Completely avoidable

- Application logging
- Evidentiary support

# Case study: Financial firm

CEO makes bold security statement on CNN

- Firewall/IDS alerting ensues

Company calls external CSIRT to investigate

# Case study, cont'd

## Logging sources

- Router (netflow)
- Firewall
- Web server
- All quiet in middleware
- Database transactions

None of it was useful

- Why?

# Case study, cont'd

## Impact

- No downtime
- Costs ~ USD\$250k
- No attacks found
- Firewall bug fixed

## Completely avoidable

- Cohesive logging
- Time synchronization

# If it were simple...

It's not just as simple as logging everything

- That often gives away too much data
- Seriously

# Embedded systems too

Seen on a Boeing 747-400 while the system was being rebooted

- Due to an electronic fault

A photograph of a computer monitor displaying a boot sequence for a Red Hat Linux system. The text on the screen includes: '(Panasonic Avionics Corporation) release, version ("560242-312" v "01.01" 1 "000 2") - built 15:15:04, Nov 7 2006', 'Platform: SH (I386)', 'Copyright (C) 2000, 2001, 2002, Red Hat, Inc.', 'RAM: 0x00000000-0x0009e000, 0x00100000-0x01060000 available', 'verifying MBR... Fix MBR:', 'Partition 0: already exists', 'Partition 1: already exists', 'Partition 2: already exists', 'Partition 3: already exists', 'verifying image... OK.', '== Executing kernel in 5 seconds - enter ^C to abort using Interrupt SMIs for SMBus.', 'SMBUS = 0x0', 'VFS: vmba = 0x500', 'Load Address: 0x00000000', 'Image length: 0x0077252', 'Loading kernel binary...', 'Red Hat signature: ...', '...'

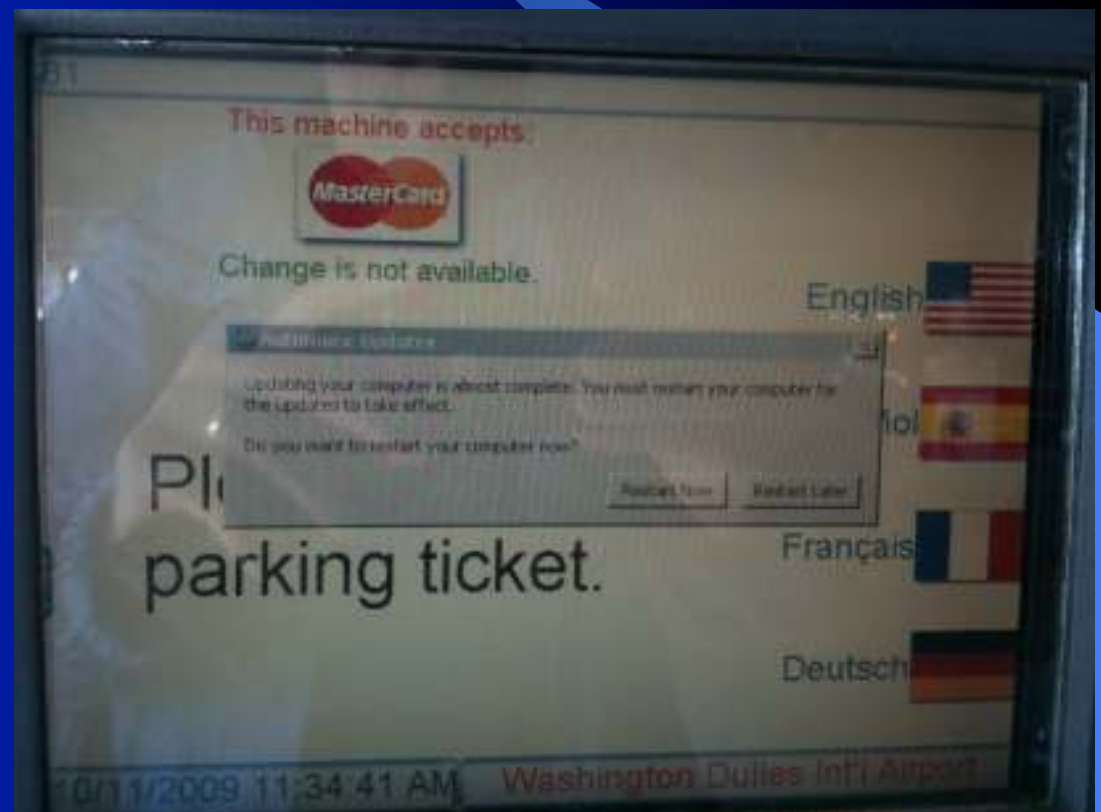

# Not serious enough?

Seen on an ATM  
Some customer  
cards caused a  
system fault...

# Even the little mistakes count

Automated parking  
kiosk at IAD  
airport

# Web sites too

## CNN mobile portal

# Mistakes remembered

The public sees these mistakes and remembers them

*We've got to do better*

Until then, this is not “engineering” in any sense of the word

# So let's learn from history

Consider some  
guiding principles

- Beyond Saltzer and Schröder

Lower level

- Address the  
OWASP Top-10,  
CWE 25, etc.

# Input and output validation

## Positive validation

- Proven safe, or else dangerous

## Safely output mistrusted data

- Cause no harm in output environment

Always

# Protect secrets

Sensitive info must be protected

- In transit and at rest
- Commensurate to value

Key management is everything

- Except for all the rest

# Anticipate and handle errors

Assume things will go wrong

Anticipate

Use the toddler-in-traffic metaphor

# Protect session and state

When working in non-stateful medium

–It's up to the application

State mechanisms must be protected

–Confidential

–Random

–Unforgeable

–Tamper-evident

# Authenticate your users

Who are you?

– Prove it

Commensurate to  
value

Feasibility matters

## Log in

Username:

\*\*\*\*\*

Password:

\*\*\*\*\*

# Control access

One simple question

- Are you authorized to do what you're requesting?

Every sensitive function, data, etc.

- Needs to be designed in

# Integrate into the enterprise

Consider what the CSIRT will need from your app

- Block the attacks
- Log what happened
- Take evasive action
  - Driven by policy

Just to name a few...
