Public Key Infrastructure Fundamentals

Prof. Bart Preneel
COSIC – KU Leuven - Belgium
Firstname.Lastname(at)esat.kuleuven.be
http://homes.esat.kuleuven.be/~preneel
February 2015

Thanks to Paul van Oorschot

1

Goals

- Understand how public keys can be distributed and revoked on a large scale
- Understand what a CA-based PKI is and what the problems are with their deployment
- Understand how multiple CAs can interoperate depending on their trust relationship

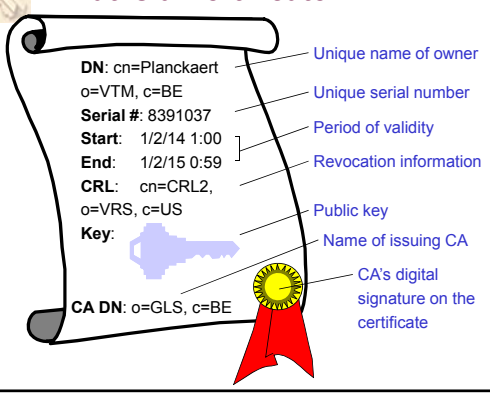
2

How to establish public keys?

- point-to-point on a trusted channel
  – *mail business card, phone*
- direct access to a trusted public file (registry or database)
  – *authentication trees*
- on-line trusted server (bottleneck)
  – OCSP*: Online Certificate Status Protocol*
- off-line servers and certificates
  – *PKI: Public Key Infrastructure*
- implicit guarantee of public parameters
  – *identity based and self-certified keys*

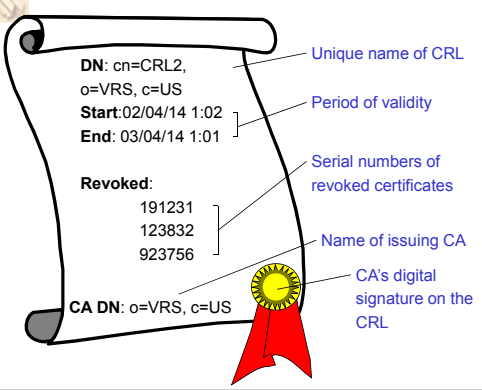
3

What is a Certificate?



4

What is a Certificate Revocation List?



5

PKI Overview

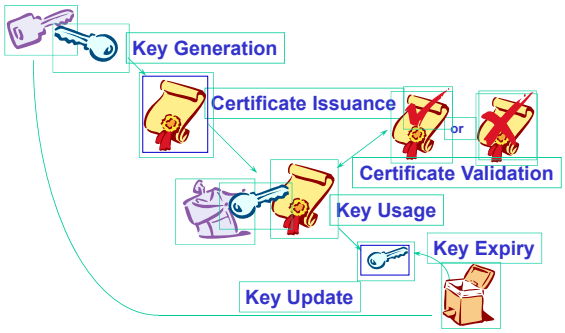
1. Background:
   Keys and Lifecycle Management
2. PKI components (“puzzle pieces”)
3. Trust Models

Background:

Keys and Lifecycle Management

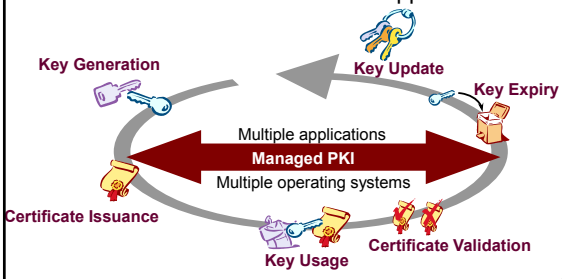
7

Key Lifecycle Management



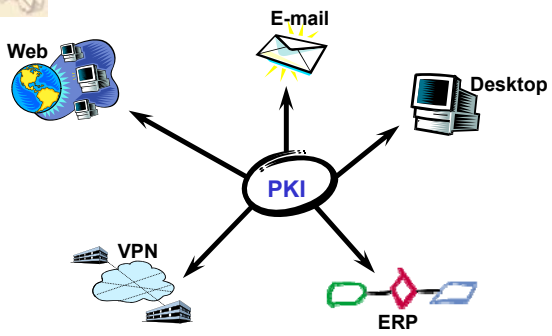
Fundamental PKI features

- Automated and transparent key and certificate lifecycle management
- Consistent behavior across applications



9

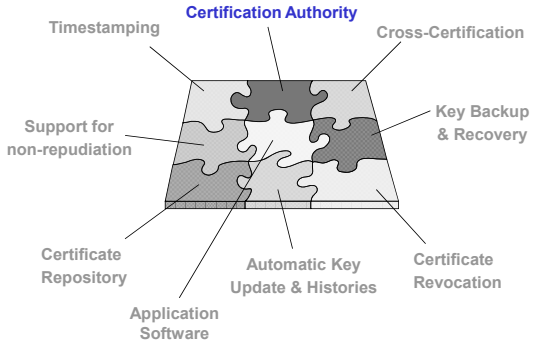
PKI should provide Unified Security



This vision from late 1990s has never materialized!

10

Certification Authority



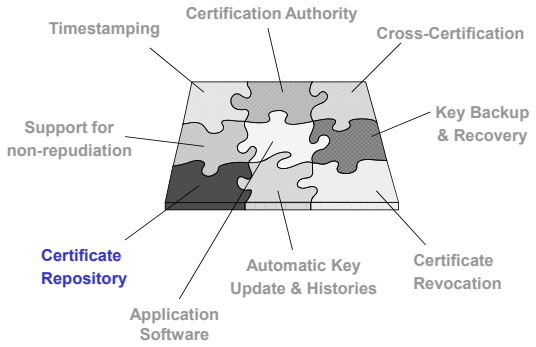
11

Certification Authority

- Issue certificates for all entities / devices (for multiple applications) from a single CA
  - single system saves h/w, s/w, training, personnel
- Flexible certificate policy / security policy
  - tailor to needs of environment, application or entity (e.g. certificate lifetime, crypto algorithms, keylengths, password rules, ...)

12

Certificate Repository



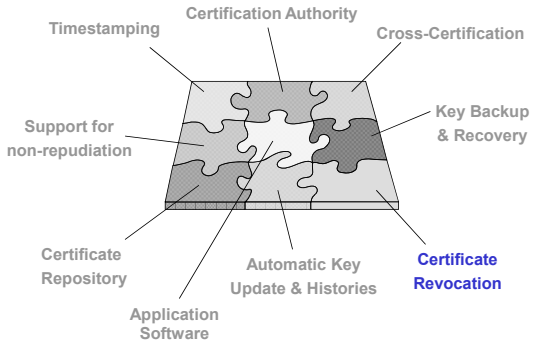
13

Certificate Repository

- LDAP-compliant directory stores certificates
  - standards-based for interoperability
- Directory products built specifically to address scalability issues
  - X.500 or proprietary schemes to replicate data (scales to millions of users)

14

Certificate Revocation System



15

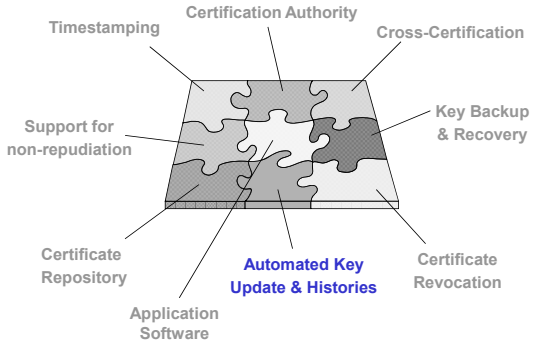
Certificate Revocation

- Automated CRL publishing
  - when certificate revoked, CRL can be automatically published to directory providing near-immediate availability
  - automated CRL checking by application
  - want to avoid applications which require manual end-user actions to check CRLs for each application or certificate usage

March 2001: Verisign has issued two certificates to fake Microsoft employees
- Problem: IE did not implement revocation checking

16

Automated Key Update & History



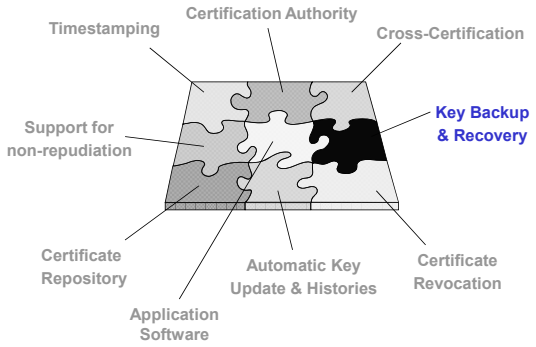
17

Automated Key Update & History

- Users should never even need to know they have their own certificates (password only)
- If key management is not automated or does not provide key history . . .
  - when certificate expires, lose access to all past encrypted data, e-mail, . . .
  - user must request new certificate and repeat entire registration process
- Should replace key, not just new expiry date
- Transparent triggering mechanism, ideally

18

Key Backup & Recovery



19

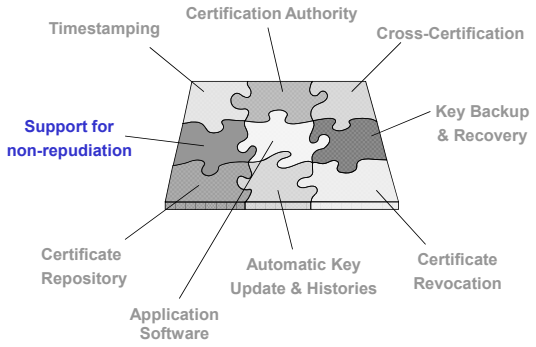
Key Backup & Recovery

- Enterprise will lose valuable (stored) data if keys used to encrypt data are not backed up
  - 20-40% of users forget passwords / year
  - employees leave the organization
- Allows the enterprise to control the backup
  - not reliant on 3rd parties
  - should be configurable to require multiple administrators to authorize access

Key recovery/backup should not be confused with **key escrow**; governments have tried to impose this for encryption keys used for communication

20

Support for Non-Repudiation



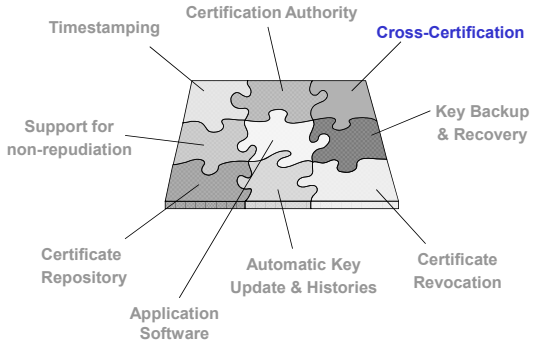
21

Support for Non-Repudiation

- Must use separate key pairs for digital signatures and encryption
  - want backup of encryption keys, **do not** want backup of signature private keys
- Separate key pairs allows lifecycles to be managed independently
- Different policy controls for each key pair
  - security requirements per pair may differ, e.g. valid lifetimes

22

Cross-Certification



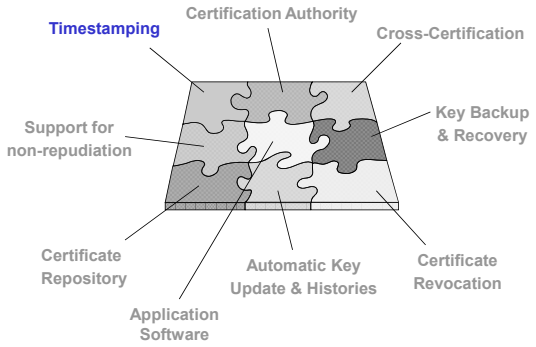
23

Cross-Certification (cf. Trust models)

- Sufficiently flexible to model existing business relationships
  - includes 1-1 relationships and hierarchies
  - cross-certificate associated with an organization (vs. a service provider)
  - compare to web trust model: trust anyone signed by browser-embedded CAs
- Enterprise manages cross-certification policy & procedures, to reduce business risk
  - cross-certifcates created by authorized administrators, transparent to end-user

24

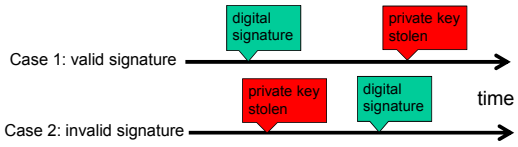
Timestamping



25

Timestamping

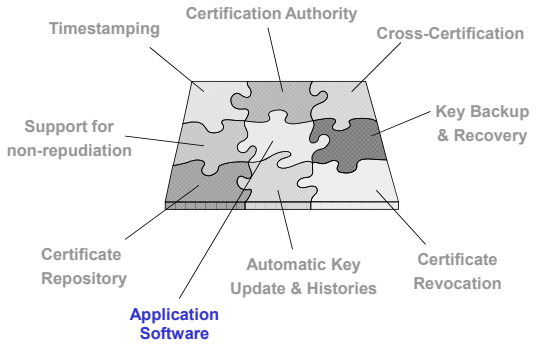
- Legal requirements
- Business requirements related to fixing transactions in time
- Technical requirements related to certificate revocation (non-repudiation)



Question: why is it not sufficient to include a timestamp in the signed text?

26

Application Software



27

Application Software

- Designed to be enabled to use the PKI ("PKI-ready")

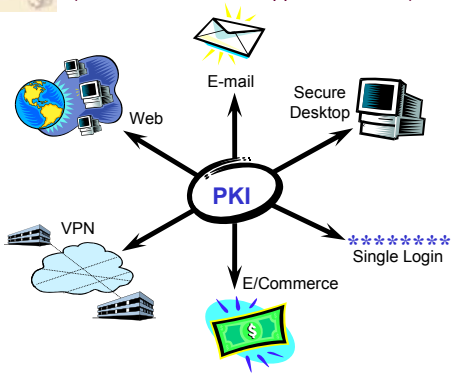
application software
(email, file encryption, VPN, web security/SSL, ...)

PKI: key & certificate lifecycle mgmt (certificate validation, key update, ...)

crypto algorithms (symmetric encryption, signature, hash, MAC, key establishment, …)

28

PKI-ready application software completes the picture (but this still has not happened in 2014)



29

Summary - Essential PKI Components

Much more than a "certificate server" or set of toolkit calls

- Certification Authority
- Revocation system
- Certificate repository ("directory")
- Key backup and recovery system
- Support for non-repudiation
- Automatic key update
- Management of key histories
- Cross-certification
- PKI-ready application software

30

More info: IETF PKIX Working Group

www.ietf.org

- de facto standards for Internet PKI, X.509-based
- Certificate & CRL Profile [PKIX-1]: RFC 2459
- Certificate Mgmt Protocols [PKIX-CMP, PKIX-3]: RFC 2510
- PKIX roadmap: www.ietf.org/internet-drafts/draft-ietf-pkix-roadmap-01.txt

31

PKI vs. Privilege Management

- Public key certificate binds a public key to an entity
- Establishes who owns a key vs. what privileges that key / owner is granted
- Certificate-processing software (relying party) may implicitly grant privileges
- Privilege Management Infrastructure (PMI) makes privileges explicit
- PMI may utilize PKI as base infrastructure
- example: attribute certificates

32

Key generation: where?

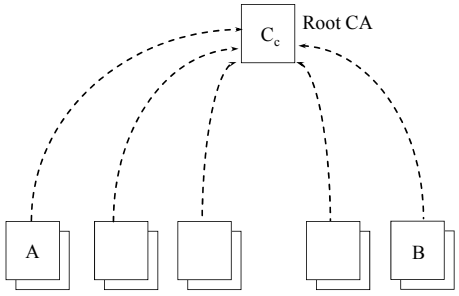
- CA generates key for user
  - absolute trust
  - need transport of private keys
  - easier management for backup/recovery
- user generates his/her key
  - does user have the expertise? (ok if smart card)
  - need to transport of public keys (integrity channel)
- specialised third party generates keys

33

Trust Models

34

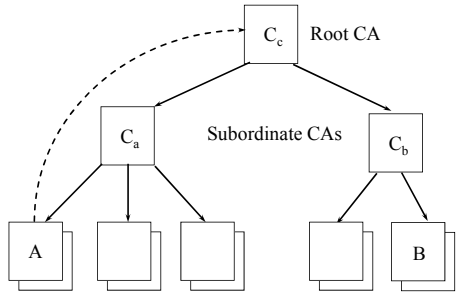
Hierarchical trust model



Relying parties transfer risk to the Root CA

35

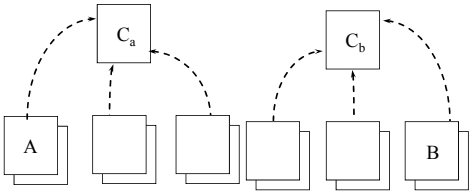
Hierarchical trust model



Root CA "deputizes" subordinate CAs, which issue certificates

36

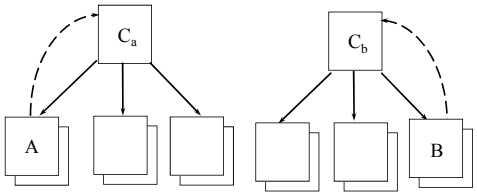
Enterprise trust model



Relying parties transfer risk to their local CA

37

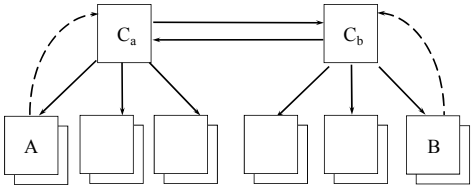
Enterprise trust model



The same local CA issues certificates to these parties

38

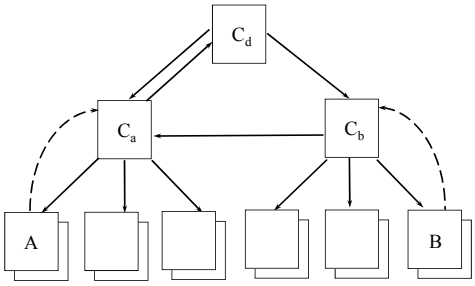
Enterprise trust model



Qualified relationships between CAs are established

39

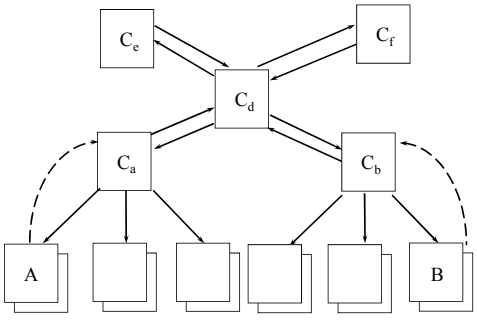
Enterprise trust model



Hierarchical relationships are a special case

40

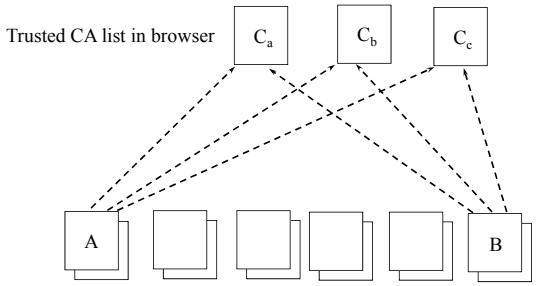
Enterprise trust model



Spoke-and-hub model is another special case

41

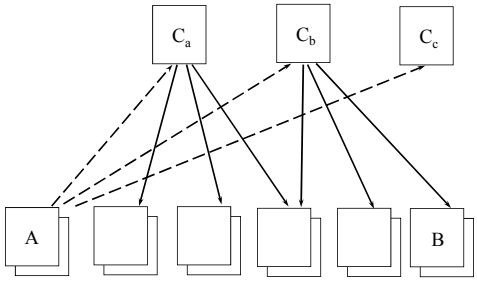
Browser trust model



All relying parties rely on public keys of same set of CAs

42

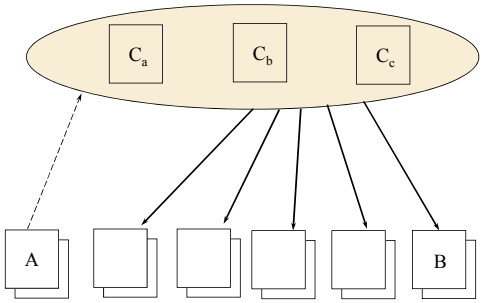
Browser trust model



Each of these CAs defines its own community of trust

43

Browser trust model



A relying party trusts the union of these communities

44

The CA Mess on the web

[Eckersley10] "An observatory for the SSLiverse"

- 10.8M servers start SSL handshake
- 4.3M use valid certificate chains
- 650 CA certs trustable by Windows or Firefox (industry: only 65 main)
- 1.4M unique valid leaf certs
  - 300K signed by one GoDaddy cert
- 80 distinct keys used in multiple CA certs
- several CAs sign the IP address 192.168.1.2 (reserved by RFC 1918)
- 2 leaf certs have 508-bit keys
- Debian OpenSSL bug (2006-2008)
  - resulted in 28K vulnerable certs
  - fortunately only 530 validate
  - only 73 revoked

How can we fix this mess?

45

CA incidents

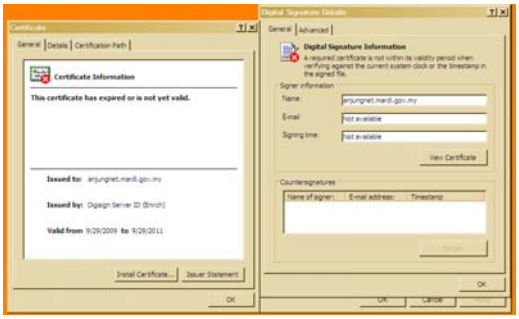
- March 2011 – Comodo: 9 fraudulent certs
  - via RA GlobalTrust.it/InstantSSL.it
- Summer 2011 – DigiNotar: 500+ fraudulent certs
  - meet-in-the-middle attack against Google users in Iran (300K unique IPs, 99% from Iran)
  - filed for bankruptcy 20 September 2011
- January 2013 – Turktrust CA incident

- (Globalsign) – may have been hacked in 2011
- (Versign) – may have been hacked in 2010
- Bit9, a company that provides software and network security services to the U.S. government and at least 30 Fortune 100 firms lost signing key in February 2013

46

CA incidents

- Malware signed by key of Government of Malaysia



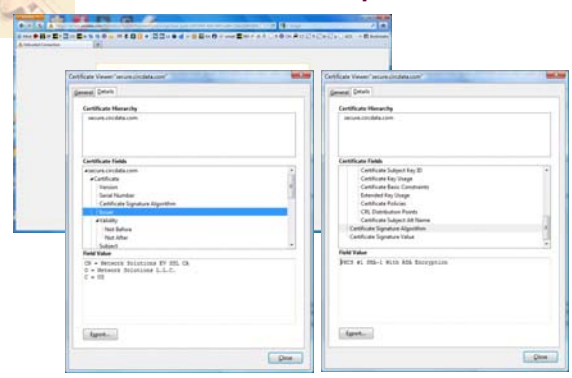
47

Improvements to CA ecosystem

- DANE – based on DNSSEC – specify restrictions for a given SSL/TLS server
  - would need hard fail
- CA Authorization (RFC 6844): tell CA - if you are not one of the CAs on this list, don't issue certs for this domain (competition issue?)
- Pinning: tell clients - cert for this site look like this; if you detect something else, this may be a breach (more likely a misconfiguration)
  - not for "smal" sites? (need bootstrap)
- Cert Transparency: certs public

48

CA common problem



49

Personal trust model (and related: "web-of-trust")

- all entities are end-users (CAs do not exist)
- keys are essentially self-guaranteed
- some end-users may also be *introducers*
- end-user imports public keys of others

CHARACTERISTICS

- suits individuals, not enterprise/corporations
- user-centric
- requires security-aware end-users
- poor scalability

50

PGP/GPG Key Servers

- Centralized support for web of trust: servers that hold huge public key rings
  - update to each other, accept and send updates from/to everyone
  - better than everyone keeping a huge key ring
  - server addresses included with PGP/GPG software
  - concerns: privacy, user registration/verification (are you Bill Gates?) and key revocation

  Example: PGP Global Directory

51

Trust models & Revocation

- public-key systems are commonly engineered with long-life certificates
- certificates bind a key-pair to identity (and potentially privilege information)
- circumstances change over certificate life
  - keys may become compromised
  - identifying information may change
  - privilege may be withdrawn
- need ability to terminate the binding expressed in the certificate
- revocation: most difficult issue in practice

52

Revocation options

mechanisms indicating valid certificates

- short-lifetime certificates

mechanisms indicating invalid certificates

- certificate revocation lists - CRLs (v1 X.509)
- CRL fragments (v2 X.509), including ...
  - segmented CRLs (CRL distribution points)
  - delta CRLs
  - indirect CRLs

mechanisms providing a proof of status

- status-checking protocols (OCSP, ValiCert)
- iterated hash schemes (Micali)
- certificate revocation trees

53

CRL: properties

- basic CRL
  - simplicity
  - high communication cost from directory to user
- improved CRL
  - very flexible
  - more complex
  - reduced communication and storage

54

Online Certificate Status Protocol (OCSP) [RFC 2560]

- on-line query to
  - CA
  - or Trusted Responder
  - or CA designated responder
- containing
  - hash of public key CA
  - hash of public key in certificate
  - certificate serial number

55

OCSP: signed answer

- status
  - good: not revoked
  - revoked
  - unknown
- time
  - thisUpdate
  - nextUpdate
  - producedAt

56

OCSP: evaluation

- [+] positive and negative information
- [-] need to be on-line
  - risk for denial of service
  - not always possible
- ! OCSP may send you freshly signed but old information

If a browser gets **no answer** to an OCSP request, it just goes on as if nothing happened (usability is more important than security)

http://blog.spiderlabs.com/2011/04/certificate-revocation-behavior-in-modern-browsers.html

57

Revocation summary

- established standards for basic revocation
  - ITU-T X.509: 1997, ISO/IEC 9594-8: 1997
  - v2 CRLs
- more sophisticated solutions may be needed for specific applications
- revocation of higher level public keys is very hard (if not impossible)
  - e.g. requires browser patch
- even after 15 years of PKI history, revocation is problematic in practice

58

Characterizing questions for trust models

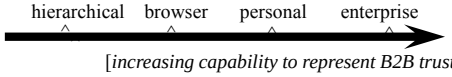
- what are the types/roles of entities involved
- who certifies public keys
- are trust relationships easily created, maintained, updated
- granularity of trust relationships
- ability of particular technology to support existing business models of trust
- how is revocation handled?

  . . . of end-users . . . of certification authorities

59

Trust model continuums

[*increasing granularity of trust*]



[*increasing capability to represent B2B trust*]

Many other continuums can be formulated

60

Trust model summary

Key idea: manageability of trust relationships

Each model has its place --

- personal trust model: okay for security-aware individuals working in small communities
- browser model: simple, large communities, everyone trusts all CAs defined by s/w vendor
- hierarchical model: best given an *obvious* global root and a *grand design* methodology
- enterprise trust model: best between peer organizations, where trust flexibility is required
- global PKI will include variety of trust models

61

Identity based encryption

- Extra material for information

62

Identity-Based Encryption (IBE)

- IBE is an old idea
  - Originally proposed by Adi Shamir, S in RSA, in 1984
  - Not possible to build an IBE system based on RSA
- First practical implementation
  - Cocks IMA 2001 and Boneh-Franklin Algorithm Crypto 2001
  - Bilinear Maps (Pairings) on Elliptic Curves
    - Based on well-tested mathematical building blocks
  - Public Key Algorithm used for Key Transport
- The IBE breakthrough is having major impact
  - Now over 400 scientific publications on IBE and Pairing Based Cryptography
  - Major deployments in industry
- Standardization Efforts
  - IBE mathematics is being standardized in IEEE 1363.3
  - IETF S/MIME Informational RFC

63

IBE Public Keys … Introduce This Elegance

Public-key Encryption where Identities are used as Public Keys

- **IBE Public Key:**

  alice@gmail.com

- **RSA Public Key:**

Public exponent=0x10001

Modulus=135066410865995223349603216278805969938881475605667027524485143851526510604859533833940287150571909441798207282164471551373680419703964191743046496589274256239341020864383202110372958725762358509643110564073501508187510676594629205563685529475213500852879416377328533906109750544334999811150056977236890927563

67

IBE Benefits

Dynamic "As Needed" Public and Private Key Generation
- No pre-generation or distribution of certificates
- Built-in Key Recovery – No ADKs
- Allows content, SPAM, and virus scanning at enterprise boundary
- Facilitates archiving in the clear per SEC regulations

Policy in the Public Key
- e.g. Key Validity Period
- No CRLs

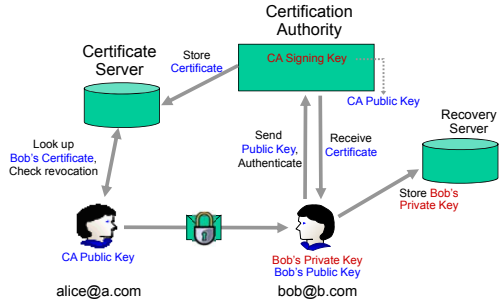
Dynamic Groups
- Identities can be groups and roles; no re-issuing keys when group or role changes

Minimal System State
- Master Secret / Public Parameters (~50KB) all you need for disaster recovery
- End user keys and message not stored on server
- Server scalability not limited by number of messages

Benefits claimed to lead to:
- High system usability
- Highly scalable architecture
- Low operational impact
- Fully stateless operation

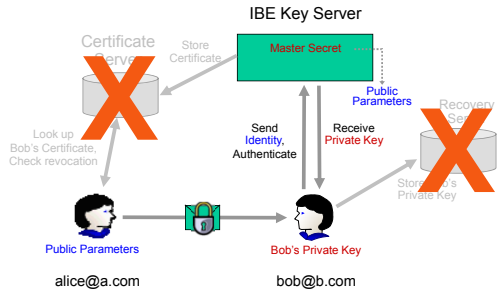
68

Public Key Infrastructure
Certificate Server binds Identity to Public Key



69

Identity Based Encryption
Binding of Identity to Key is implicit



70

IBE summary

- Sounds cool
- Lack of revocation means short-lived keys hence high overhead for recipient
- Key escrow is problematic (definitely for signatures)
  - can be avoided but only with a complex scheme that needs PKI anyway
- How do you know what the system parameters used by people with the address xx@hotmail.com?
  - Can these system parameters be revoked?

71

PKI

- Public key cryptography and public keys are essential for large scale secure systems
- PKI as we know today is designed for an off-line world in 1978
- Global PKI is very hard
  - who is authoritative for a given namespace?
  - liability challenge
- Revocation is always hard

- Things are much easier if relying party is the same as issuing party: no certificates are needed

72
